

FOOD ENERGY WASTE

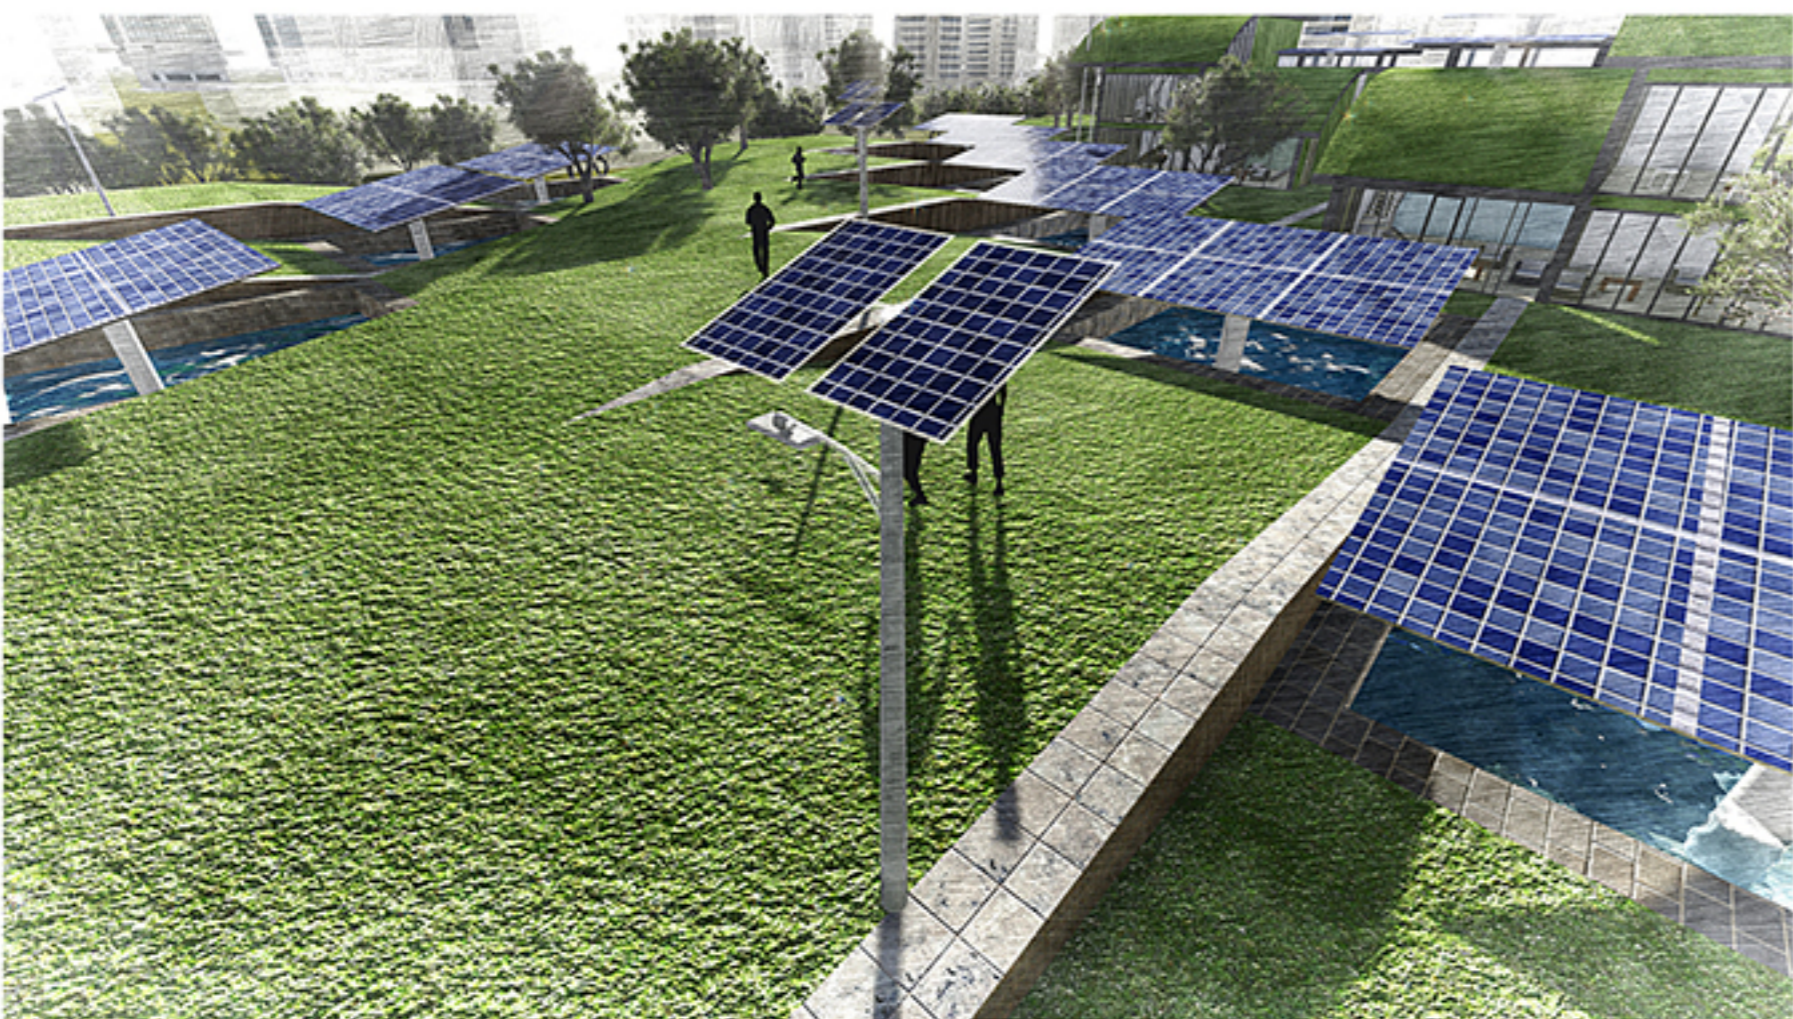

Plant the crops on the ground

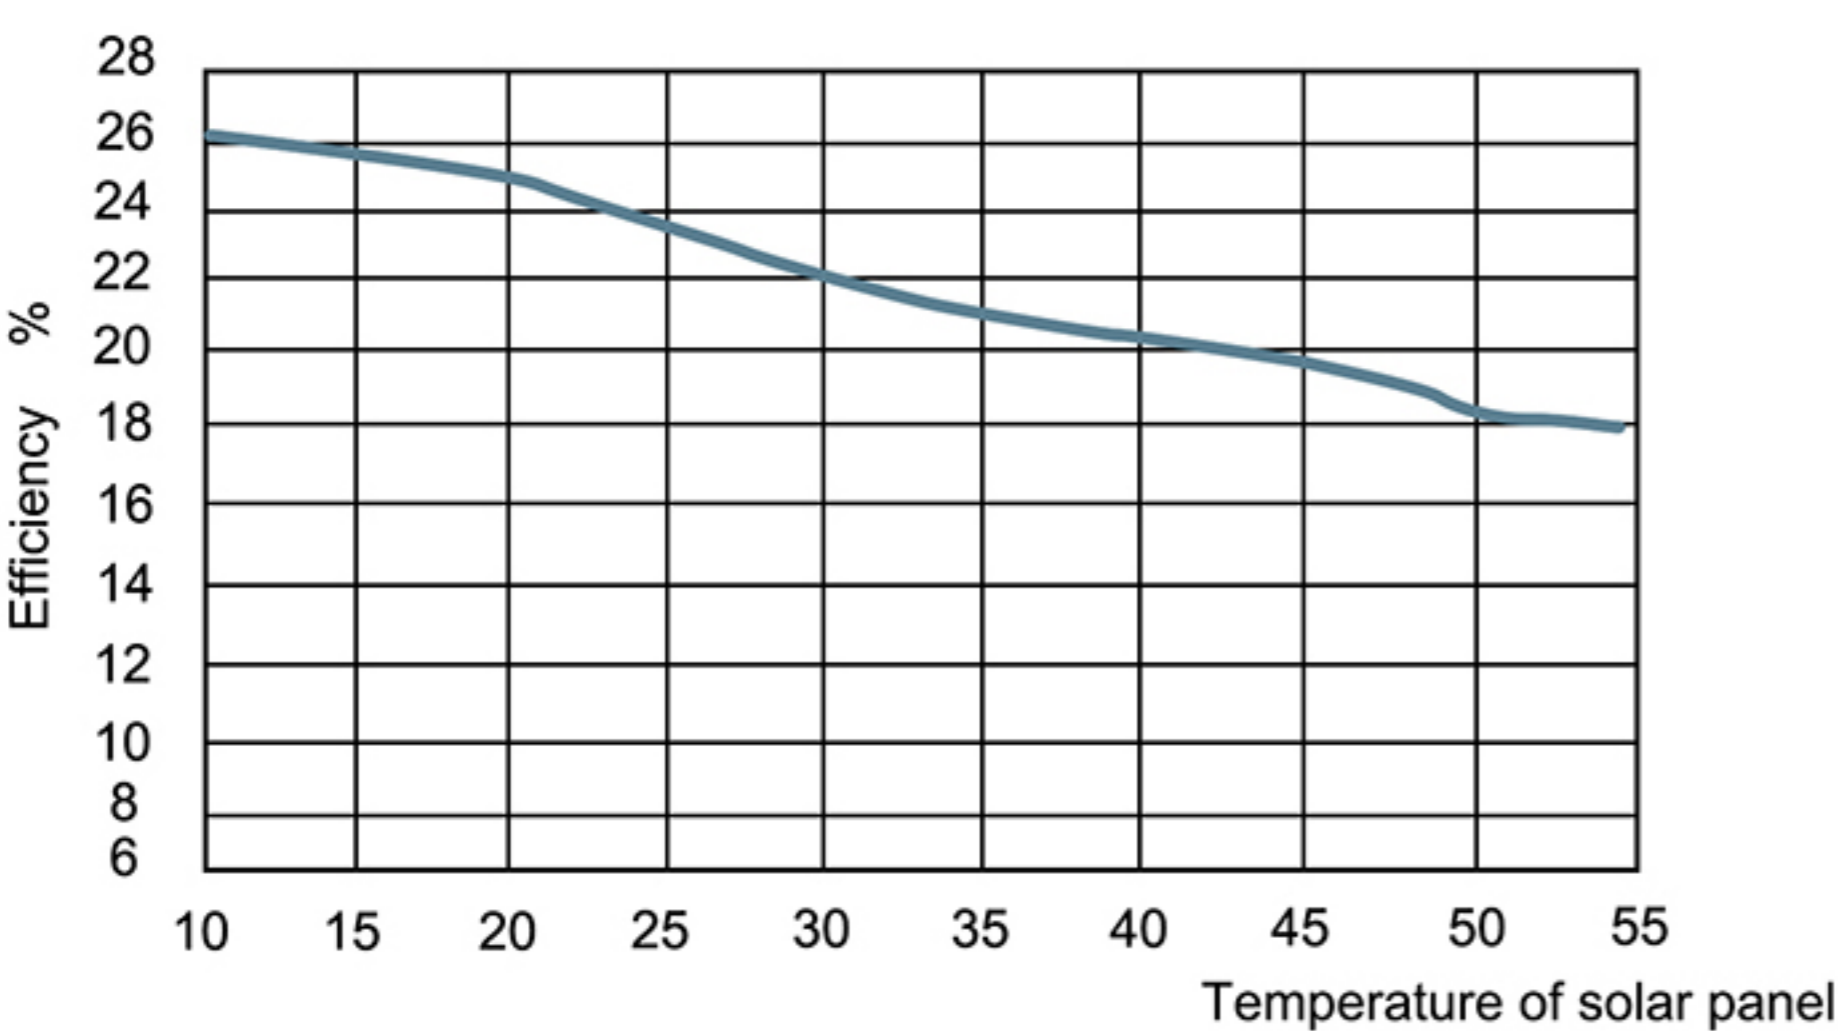

Plant the vegetation on the roof

Use the solar panels

Solar light

The waste may from the human beings activity,the factory,the crops and the outside from the site and so on.

WASTE

We can take the full advantage of the waste to fertilize the crops,generate the energy in the factory.

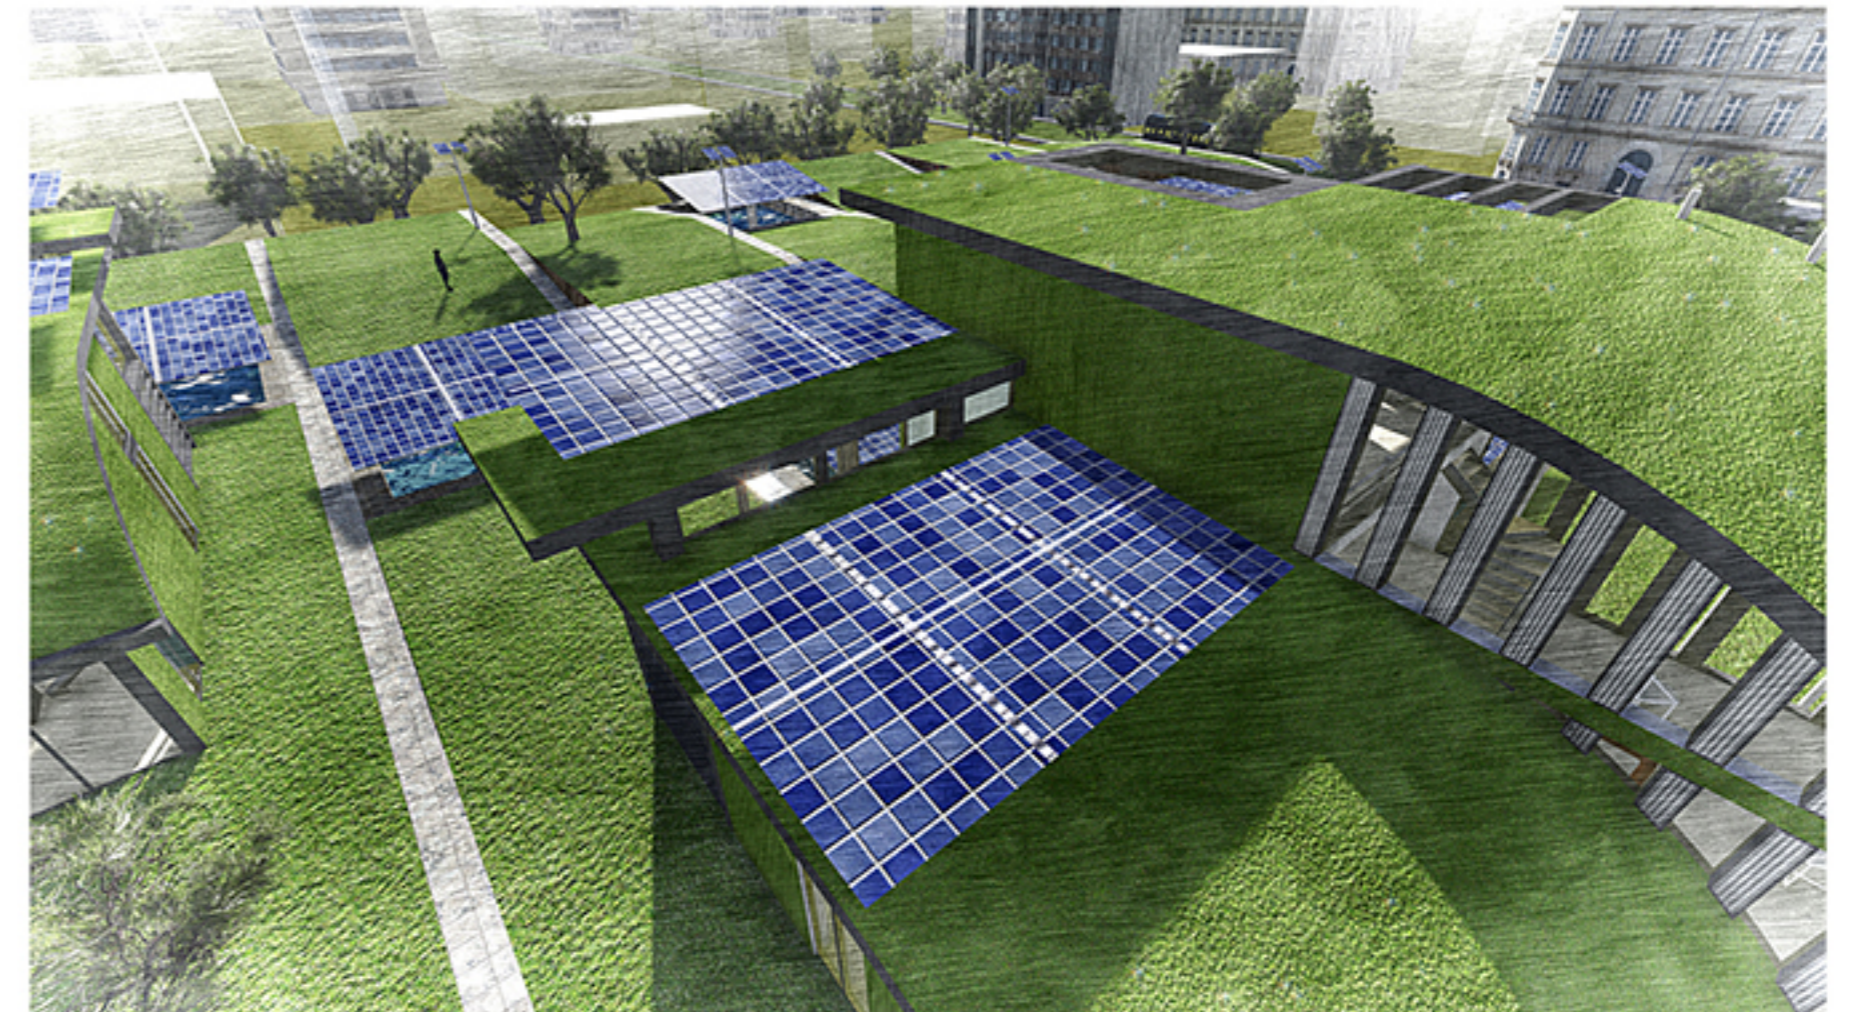

FOOD

We take the full advantage of the whole ground to plant the crops and the vegetation for eating.

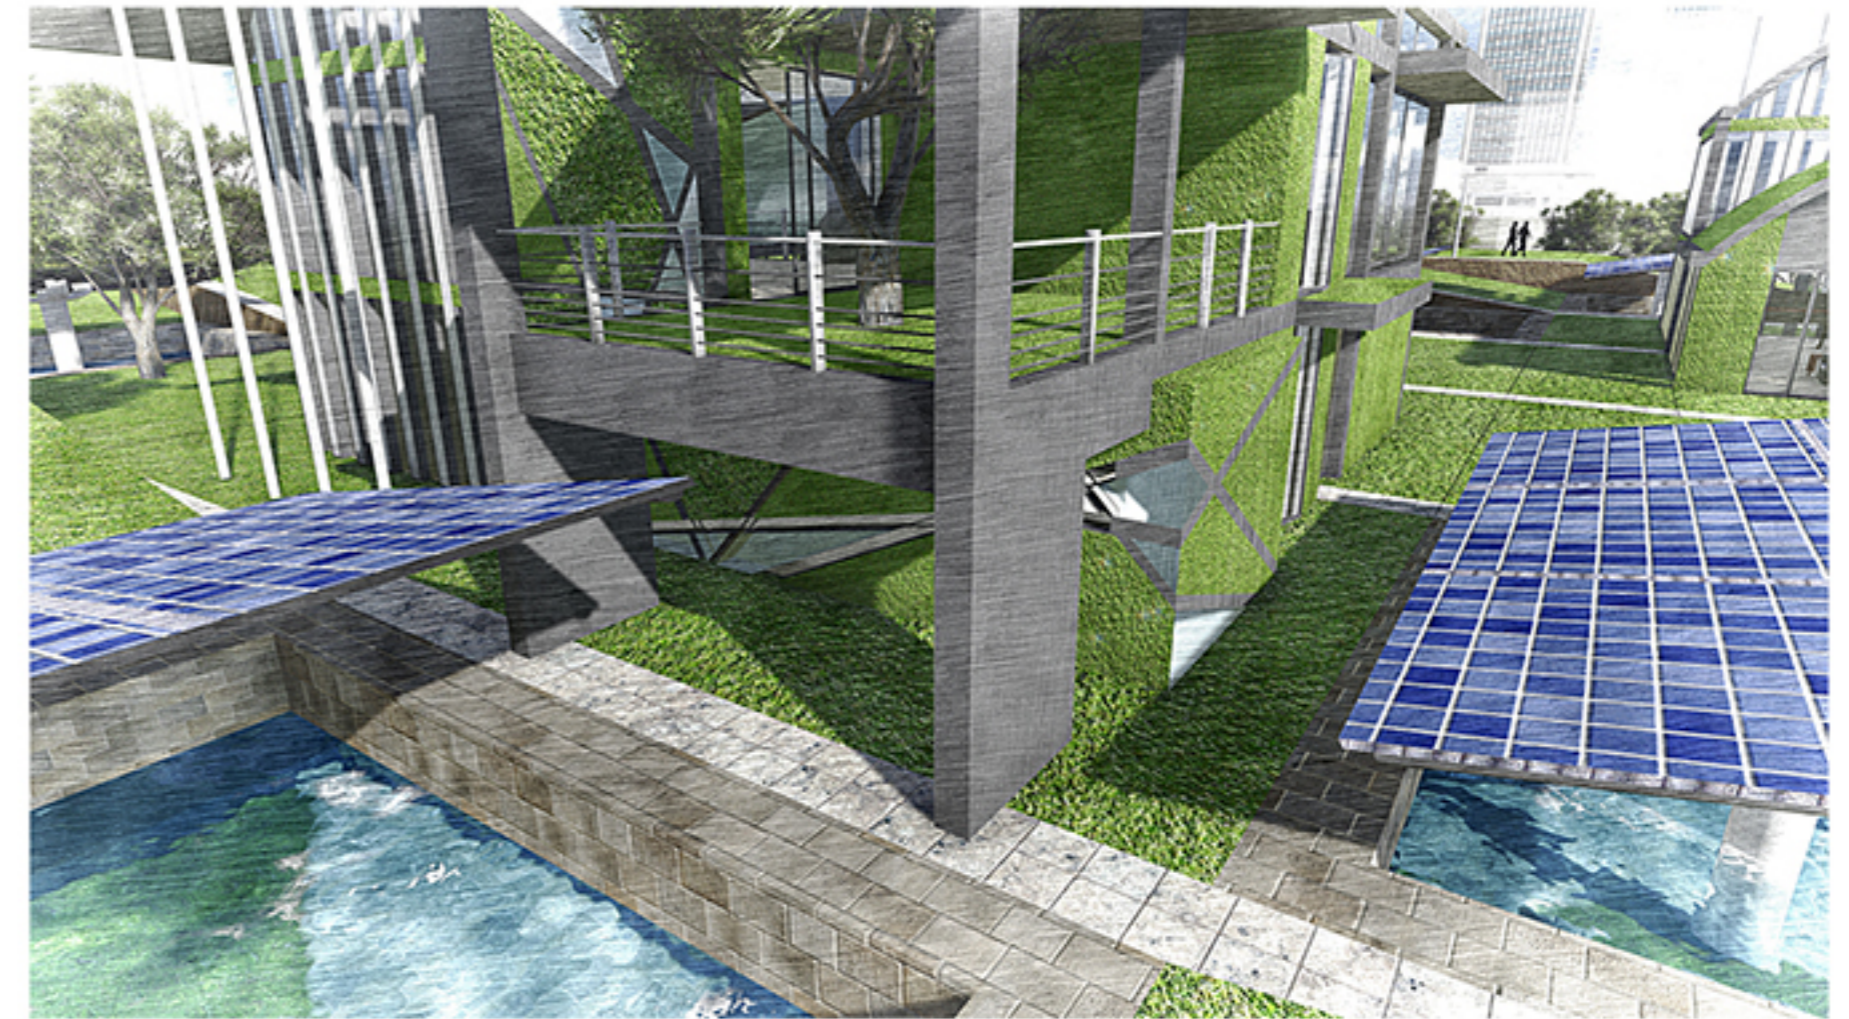

We even plant the crops on the roof of the house.We can sell the redundant crops and use it to make energy in factory.

Energy is the foundation of the human beings activity, so we use the solar energy and the bioenergy to support the whole site.
It is indeed a GREEN SQUARE.

ENERGY

Solar panels on the roof

Biogas and ethanol factory

We put the foundation and the support of the solar panels in the water.

We figure out that with the increase of the temperature,the solar panel has the lower efficiency to generate the electricity.

So we use the heat-conducting property material as the foundation and the support of the solar panels.Then we put it into the water,keeping the solar panel in a constant temperature to maintain the higher efficiency.
